

WE HAVE THE CURE FOR CORROSION AT PIPE SUPPORTS:

I-ROD[®]

THERE'S ONLY ONE REMEDY:

Installing I-Rod[™] is the only way to ensure corrosion-free pipe supports. A pipe sitting on a flat support forms a small crevice that traps water; this softens the paint and allows moisture to contact bare steel. Corrosion quickly spreads and causes wall loss.

HERE'S HOW I-ROD[™] WORKS:

Mounting the pipe on I-Rod's rounded surface minimizes the contact area, making it impossible for water to become trapped underneath. I-Rod also elevates the pipe, which increases air circulation and helps evaporate moisture while making it easier to inspect. I-Rod's durable thermoplastic material prevents metal-to-metal contact that can accelerate corrosion when wet.

WHAT DOESN'T WORK:

Rubber pads and wear pads trap even more moisture against pipes and make the problem worse.

ASTOUNDING RECORD:

I-Rod[™] is specified by most major oil companies and has been installed hundreds of thousands of times worldwide. Amazingly, in 26 years there has never been a single reported failure of a pipe protected with genuine I-Rod[™].

I-Rod[™] products are available to fit all types of supports, including Grinnells, cradles and pipe shoes. They're offered in a variety of heavy-duty coatings and materials for service in temperatures ranging from -79°C to 249°C.
